FAbstracty Gastric ulcer is a kind of gastric ulcer disease with high clinical incidence. Epigastric pain, abdominal distension, belching, acid regurgitation and nausea are the main clinical symptoms, which are mainly due to the enhancement of gastric mucosal invasion factors and the decline of its defense ability, causing ulcers to appear. Gastric ulcers are complex, protracted and difficult to heal, and are related to the patient's own mental state and emotional changes. Treatment may cause adverse outcomes such as pyloric obstruction, gastric perforation, gastric bleeding, and even canceration, which will cause serious harm to the life safety of patients. Omeprazole is widely used as a clinically used drug for the treatment of gastric ulcer. With the rapid development of medical technology, many methods of omeprazole combined with other drugs to treat gastric ulcer have been born.
